

## **SWAN-Kuststrook for operational forecasts**

### **17th Int. Waves Workshop Notre Dame**

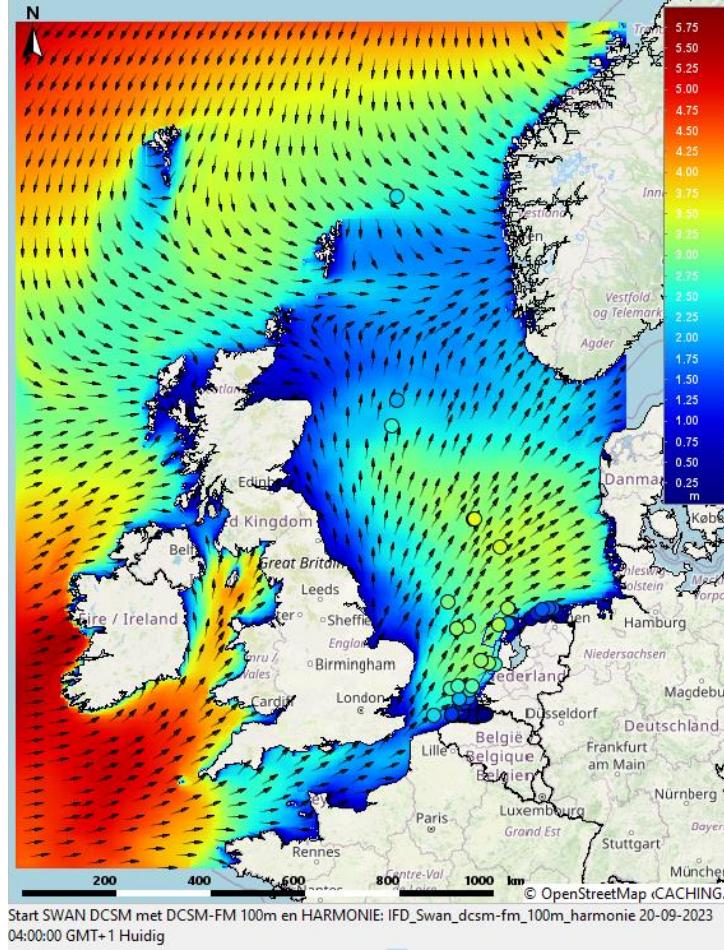

Caroline Gautier, Joana van Nieuwkoop, Menno de Ridder, Madelief Doeleman, Bart van Westen, Joost den Bieman, Gerbrant van Vledder

# Operational wave forecasts: SWAN-NS & SWAN-KS

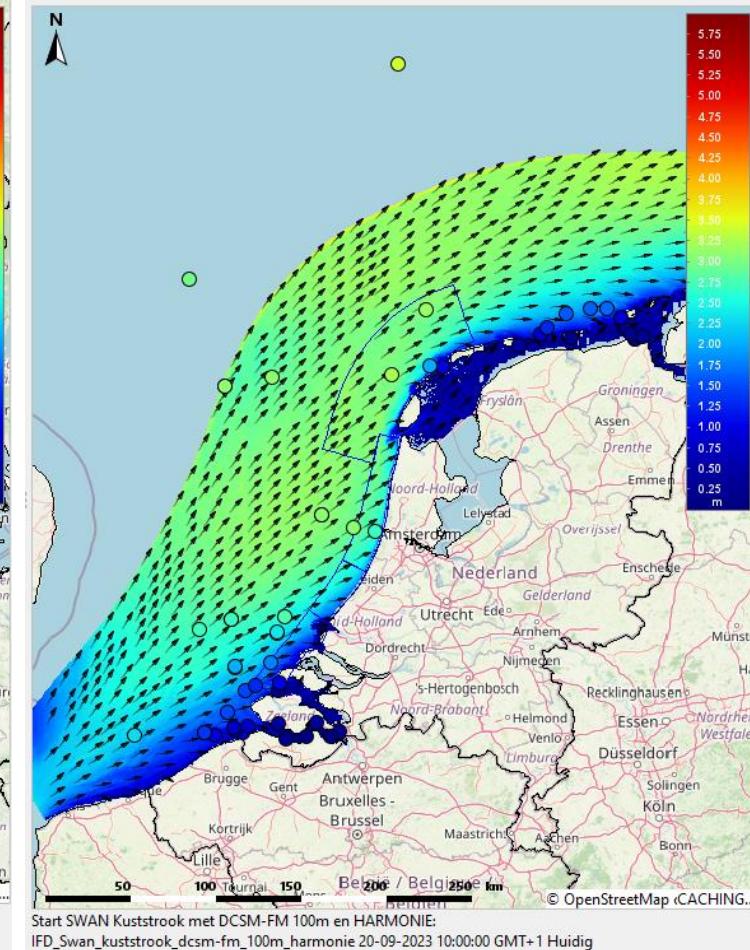

Deltares

Sep 19, 2pm

Sep 20, 4am

Sep 20, 4am

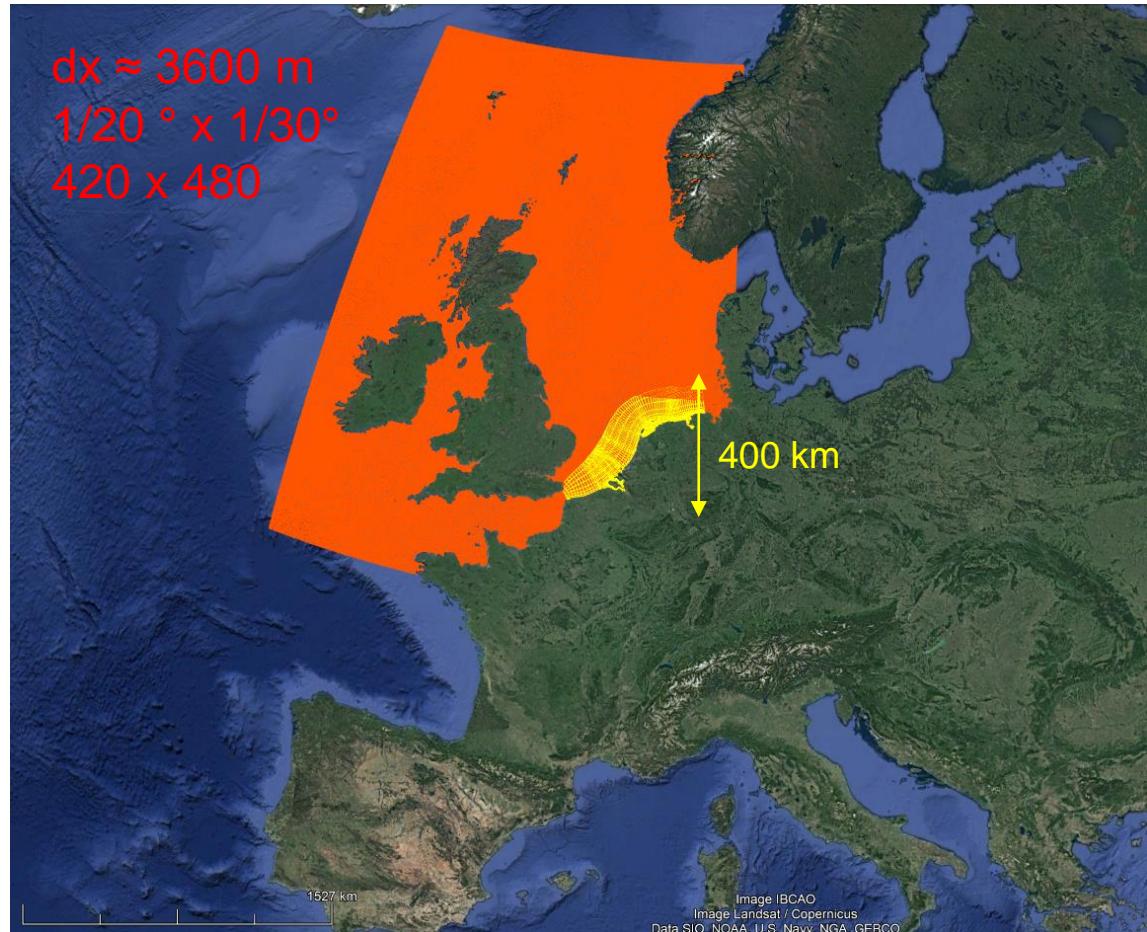

# Index

Rijkswaterstaat provides operational forecasts of **water levels** and **waves** at the North Sea, mainly for flood forecasts and safe navigation.

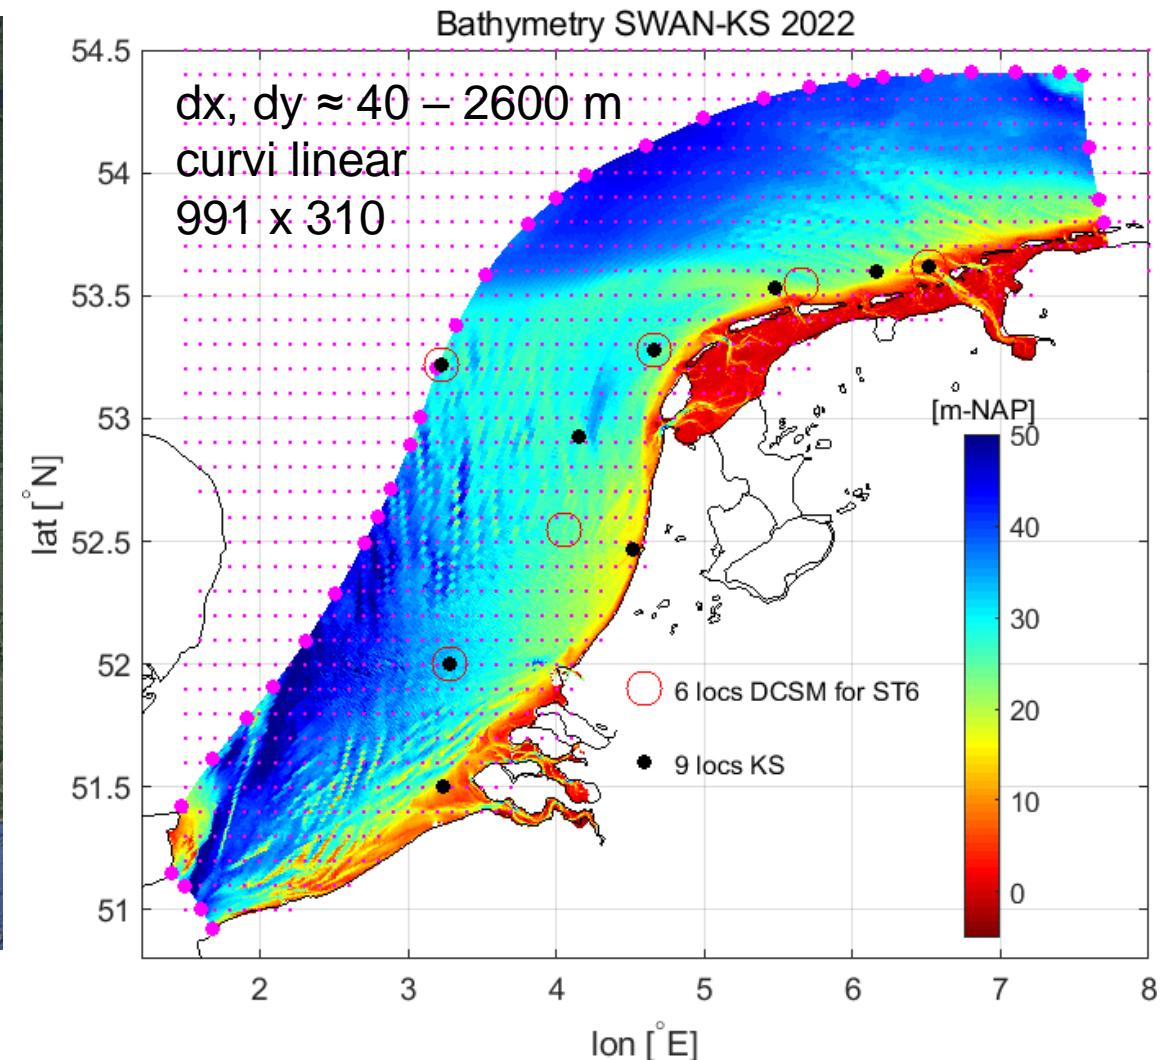

1. SWAN-Kuststrook set up
2. Model settings, ST6
3. Results
4. Correction based on data driven model
5. Conclusions

# SWAN-Kuststrook domain

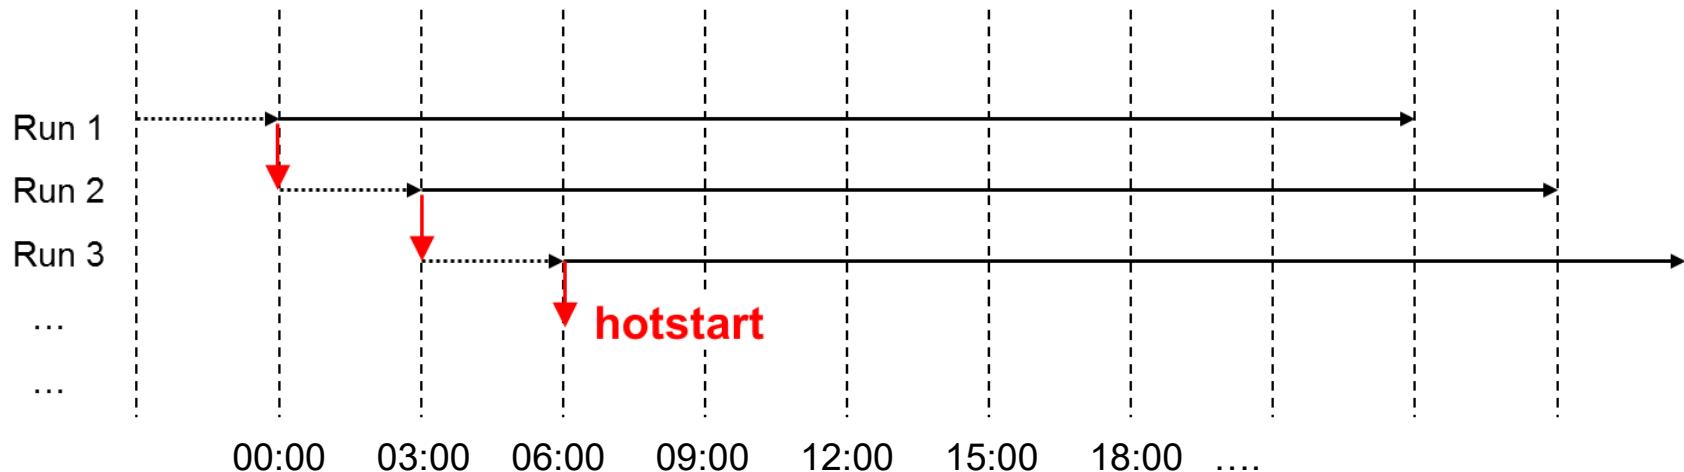

Deltares

# Every 3 hours a new SWAN run starts

- 3 hr hindcast + 48 hr forecast
- Time step: 1 uur
- Wave boundary conditions: 2d spectra HRES-WAM by ECMWF      0:00 6:00 12:00 18:00...    dt = 3hr
- Wind: Harmonie                                                                0:00 3:00 6:00 9:00...    dt = 1hr
- Water levels and currents from D-Flow FM                            0:00 3:00 6:00 9:00...    dt = 1hr

# ST6 (wind input, whitecapping, swell dissipation)

## ST6 Whitecapping (RBW, 2012)

Waves do not break unless the spectral density at a frequency exceeds a threshold, calculated from the spectral saturation spectrum.

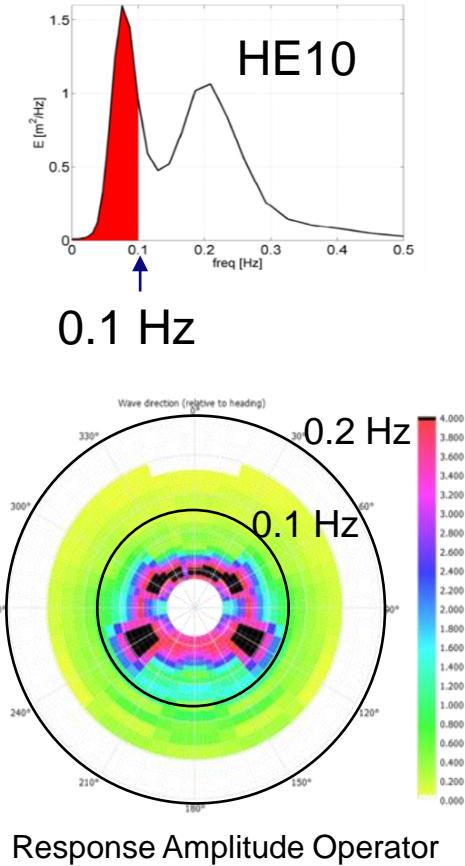

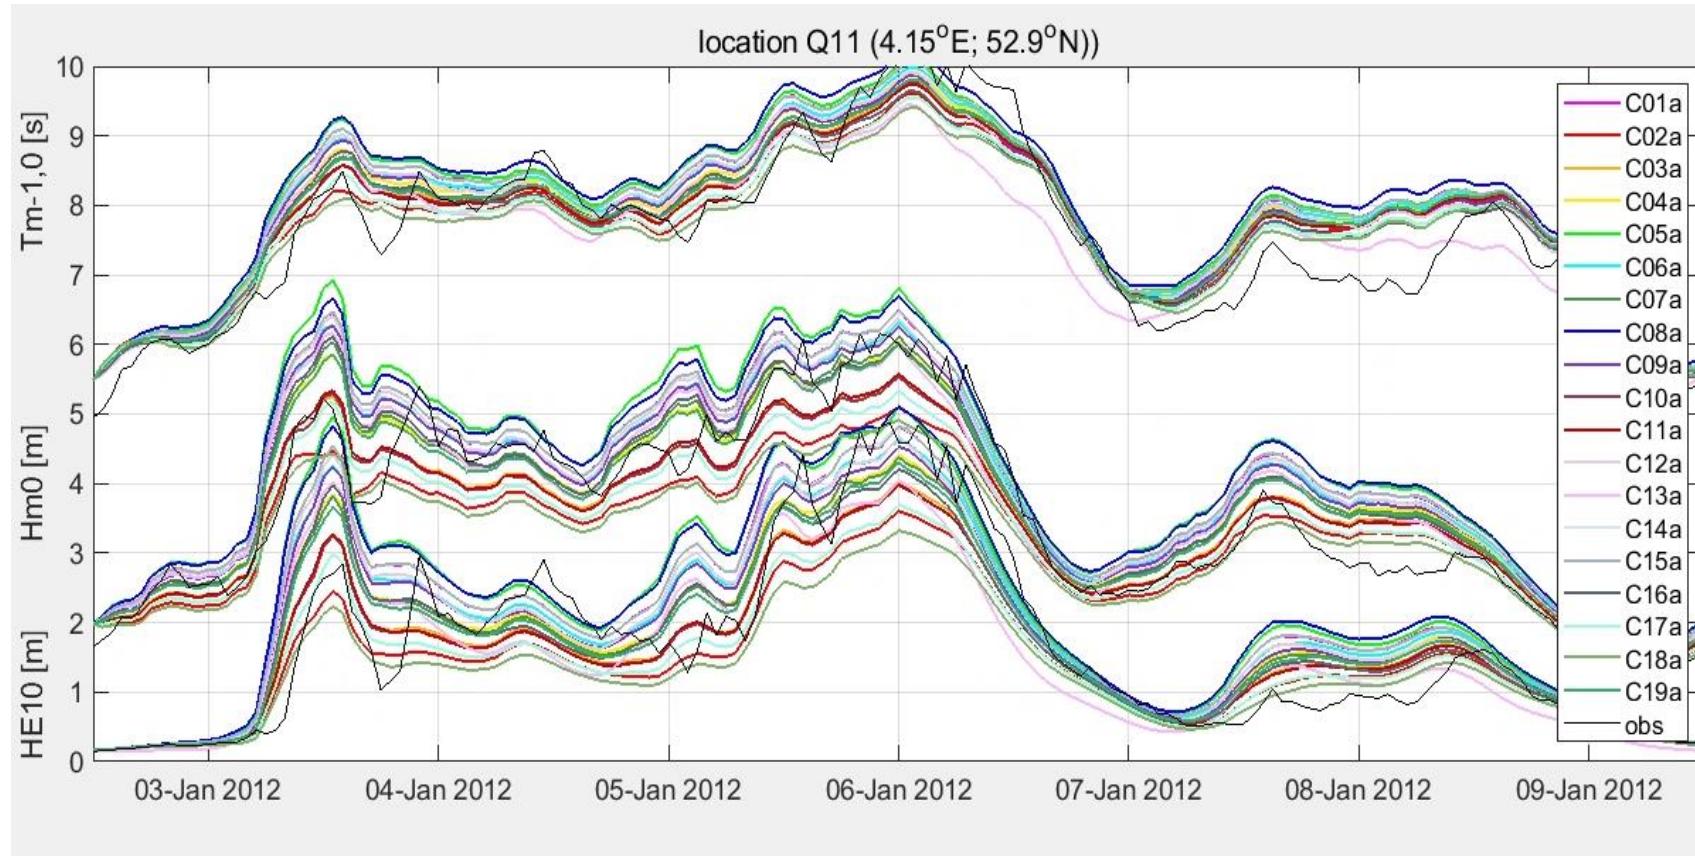

Whitecapping is composed of two components:

- T1: inherent breaking term for that specific frequency.
- T2: induced breaking of short waves due to modulation of longer waves.

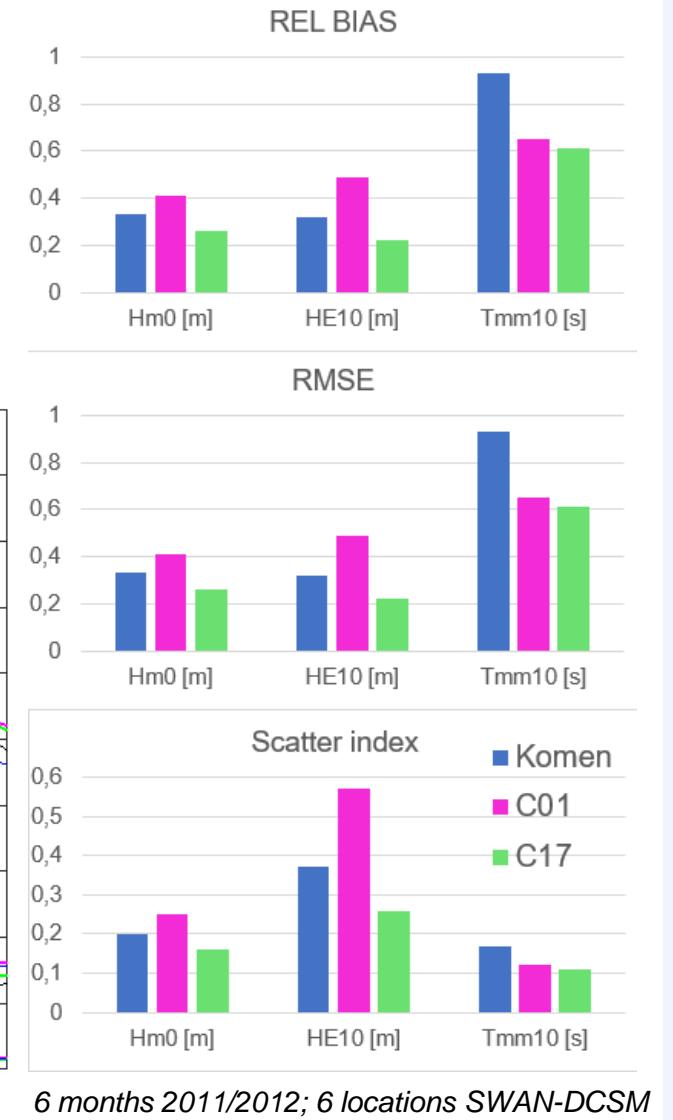

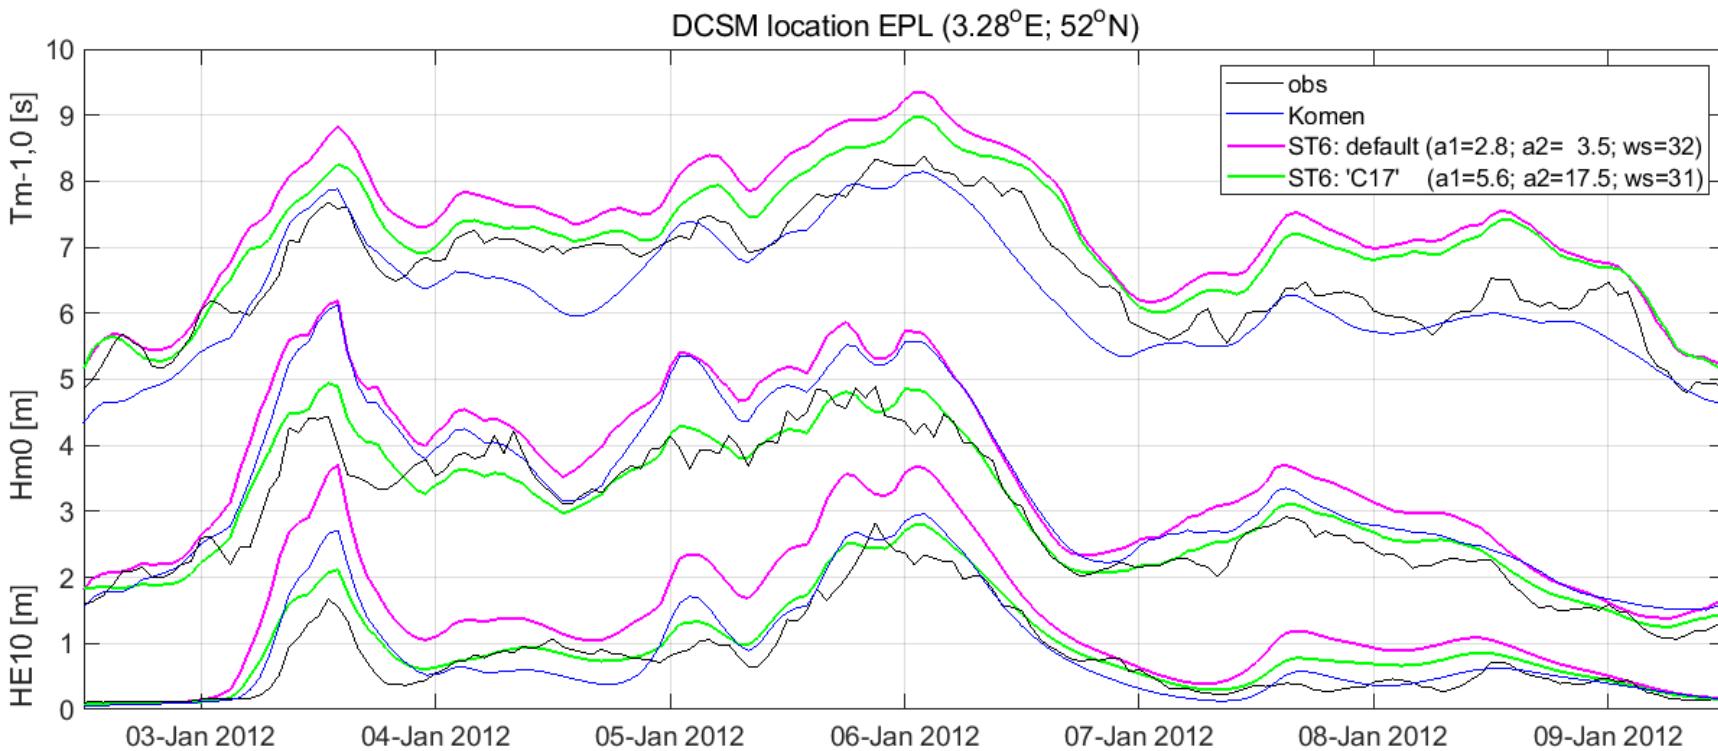

non-breaking swell dissipation term ( $C_{dsd}$ )

	$a_1$ [*10 <sup>-6</sup> ]	$a_2$ [*10 <sup>-5</sup> ]	wind scaling	friction	$C_{dsd}$
C01a	2.8	3.5	32	0.038	1.2
C02a	2.8	35.0	32	0.038	1.2
C03a	2.8	17.5	32	0.038	1.2
C04a	5.6	7.0	32	0.038	1.2
C05a	2.8	1.8	32	0.038	1.2

# Correct the SWAN-results based on data driven model

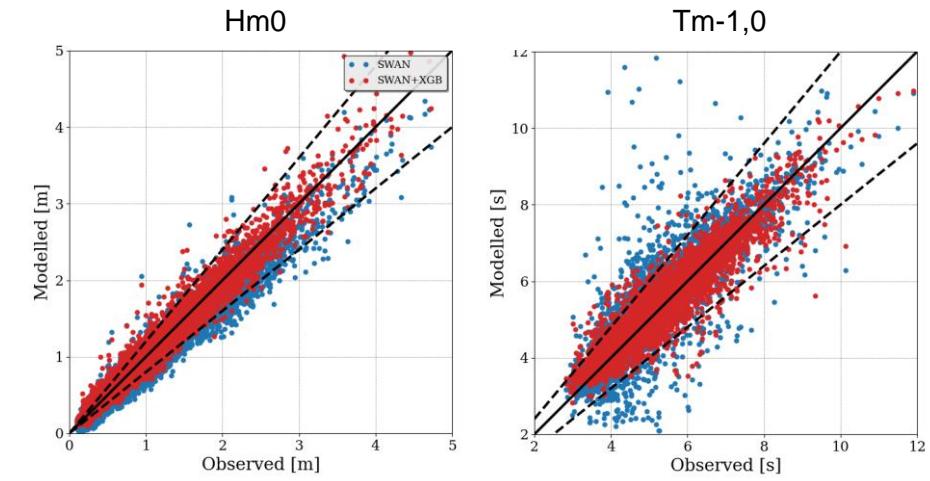

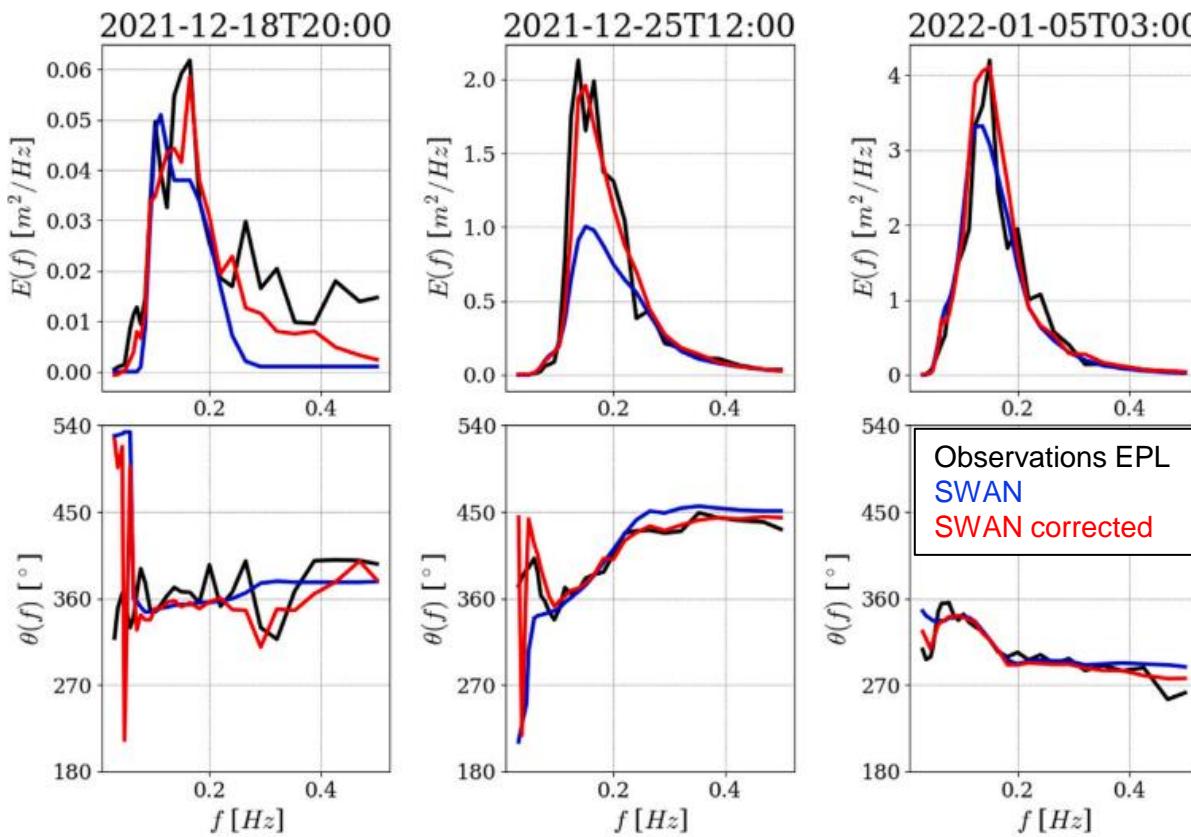

- Wind velocity as used in SWAN
- Wind direction as used in SWAN
- Water level as used in SWAN
- Significant wave height predicted by SWAN
- Spectral wave period predicted by SWAN
- Deep water wave steepness predicted by SWAN
- Wave direction predicted by SWAN
- Energy density in frequency bin predicted by SWAN
- Main wave direction in frequency bin predicted by SWAN
- Difference between wave and wind direction

$$\Delta E(f) = \frac{E_{obs}(f) - E(f)}{E_{SWAN, total}}$$

$$\Delta\theta(f) = \frac{\theta_{obs}(f) - \theta(f)}{360}$$

# SWAN results after correction

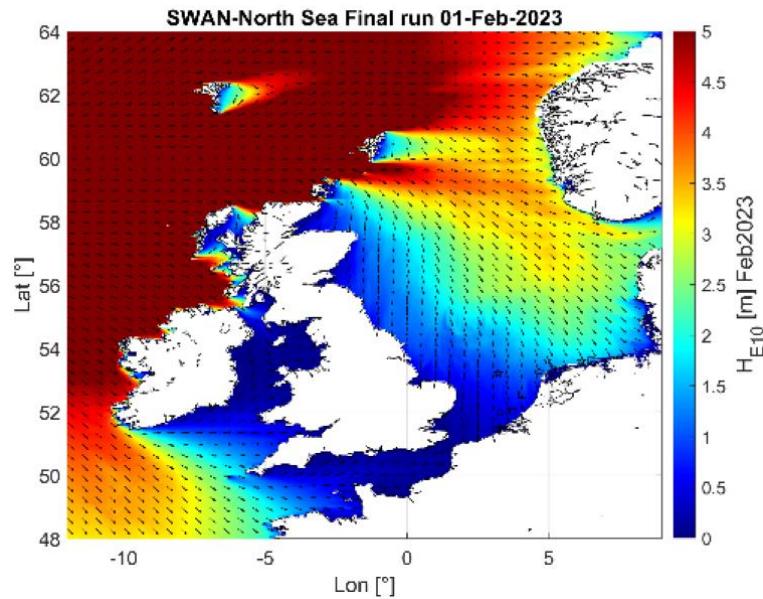

RMSE	SWAN	SWAN corrected	Improvement
Hm0 [m]	0.21	0.14	-33%
H <sub>E10</sub> [m]	0.08	0.06	-25%
T <sub>m-1,0</sub> [s]	0.67	0.41	-39%

# Conclusions

- SWAN-Kuststroom runs operationally to provide wave forecasts for the coming 2 days.
- Models forcings are HARMONIE wind, DFLOW-FM water levels and currents, and WAM-HRES wave boundary conditions.
- ST6 improves the results. Wave period increases. Wave height (and HE10) is more sensitive to settings.
- SWAN-Kuststroom has a relative bias of 1% in  $Hm0$ , -8% in  $HE10$  and -4% in  $Tm-1,0$ . The scatter is large: 17% and 31%. For wave period it is 12%.
- By means of machine learning (XG Boost) we adjust the computed spectra, based on years of trainingsdata (SWAN results and observations)

# Future plans

- Boundary conditions (WAM-HRES or SWAN-DCSM)

- Shallow water physics: triads and breaking (see next presentation)
